Theme	<b>Replacement of Pneumatic Tubes</b>	Posting expires: Basic knowledge <b>Problem case examples</b> Improvement case examples

When pneumatic pipe lines are in good flexible condition they retain their original color (sky blue) and need not to be replaced on time based maintenance principle. They can still function further.

Whenever it is observed during schedule maintenance that the tubes color have changed- check & replace.

Direct heat ,even from sunlight, affects these pipes very much and with prolong exposure to heat they get burnt and loses their flexibility and gets hard and brittle. Hardened pipes crack and spilt very easily and should be replaced. When they are in that stage their color becomes dark as shown in picture.
